
INSTRUCTIONS FOR TESTING AND UTILIZING ENZYME JAPAN PRODUCTS

BISO
JICA

1. Uses:

Facilitates the treatment of BOD, COD, nitrogen, phosphorus, and total suspended solids in wastewater.

BISO JICA

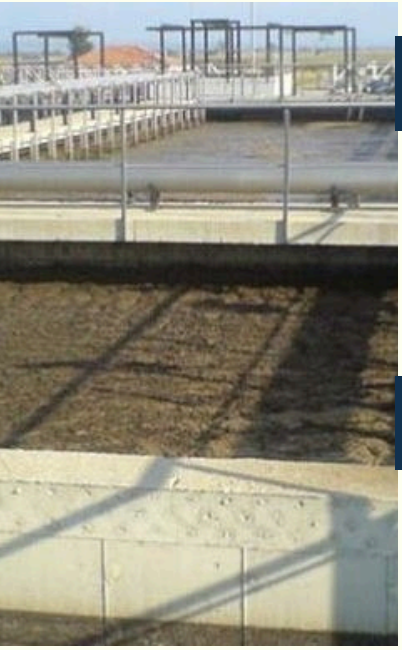
2. Location of Utilization (Khanh Hoan):

- This phase involves transferring water from the 1000m3 underground tank located in the mechanical workshop to the initial UASB tank.

3. Preparation methods:

Draw 20 ml of enzyme and incorporate it into a 1000-liter tank.

Water (free from chlorine or bleach), stir thoroughly. It may be utilized after 30 minutes.



4. Instructions for Use:

Initially, after mixing, transfer the entire contents to the 1000m³ tank after a duration of 30 minutes, repeating this procedure for three consecutive days. On the subsequent day, introduce the solution dropwise into the 1000m³ tank, akin to an intravenous drip.

5. Note:

- Prepare sufficient broth for one day's
- consumption. It can be utilized alongside probiotics to enhance efficacy.

BISO JICA

1. Uses:

Facilitates the treatment of fats and oils in wastewater.

BISO JICA

2. Location of Utilization (Khanh Hoan):

Fill the production water channels and pipes prior to passing through the trash screen and before entering the 1000m3 underground tank.

3. Preparation methods:

Combine 50 ml of enzyme with a 500-liter tank of water (free from chlorine or bleach) and stir thoroughly. The mixture is ready for use after 30 minutes.

4. Instructions for Use:

- Initially, after mixing, add 300 liters to the 1000m3 tank 30 minutes later; the remaining 200 liters should be added to position (1), and this process should be repeated for three days. On subsequent days, add 500 liters gradually to position (1).

5. Note:

- Prepare a sufficient quantity of solution
- for one day's use. After 10 days, adjust the mixing ratio to 30ml per 500 liters of water.

BISO JICA

1. Uses:

Aids in the removal of odors from the air, refuse, animal waste, mud, industrial floors, manufacturing areas, and storage basements.

BISO JICA

2. Location of utilization (Khanh Hoan):

- Mist application in the fishmeal drying facility. Spraying the floor from the security gate to the entrance of the drying facility. Spraying the floor that houses raw fish materials in the fishmeal facility.
- Spraying to sanitize truck containers.

3. Preparation methods:

Combine 100ml of enzyme with a tank containing 300-500 liters of water (free from chlorine or bleach) and stir thoroughly. The mixture is ready for use after 30 minutes.

4. Instructions for Use:

- Spray (similar to the application of pesticides) onto the surfaces of areas affected by odor-causing waste (both in front of and within the drying workshop).
- Apply the spray twice daily, once in the morning and again in the afternoon (excluding nighttime).

5. Note:

- Prepare a sufficient quantity of solution for one day's use. You may incorporate 100g of sugar during the mixing process. Outside the factory, due to traffic congestion, you can utilize a spray bottle or a modified car wash spray system with low-pressure nozzles. Inside the factory, employ the same spraying method as used outside, or consider designing a fixed misting system for added convenience.
